

# EXPERIMENT NO: 1

**Aim:** Introduction to Data science and Data preparation using Pandas steps.

## Theory:

Data preparation is a crucial step in data science, involving cleaning and transforming raw data into an analyzable format. Using Pandas, we can perform operations such as handling missing values, encoding categorical data, and scaling numerical features. Proper preprocessing ensures the dataset is reliable for analysis and modeling by addressing inconsistencies, missing data, and outliers.

## Problem Statement:

The Vehicle Safety Recall dataset, provided by NHTSA, contains 15 columns detailing various aspects of recall events, such as manufacturers, affected components, and corrective actions. This analysis focuses on:

- **Manufacturer Trends:** Identifying manufacturers prone to frequent recalls or specific defects.
- **Impact Analysis:** Understanding recall types affecting the largest populations and assessing average completion rates.
- **Temporal Patterns:** Detecting trends in recalls over time and seasonal spikes.
- **Safety Implications:** Investigating critical safety advisories like "Do Not Drive" or "Park Outside" and their resolution rates.

By cleaning the dataset and applying data preprocessing steps, the goal is to enhance its quality and draw actionable insights for stakeholders.

## Dataset Overview:

The dataset provides detailed information about vehicle safety recalls managed by the National Highway Traffic Safety Administration (NHTSA). It contains 15 columns, each capturing specific aspects of recall events. Below is a breakdown of the columns and their relevance:

1. **Report Received Date:** Date the recall was officially reported.
2. **NHTSA ID:** A unique identifier for each recall event.
3. **Recall Link:** A hyperlink to the recall details on the NHTSA website.
4. **Manufacturer:** Name of the vehicle or product manufacturer responsible for the recall.
5. **Subject:** Brief description of the recall issue.

6. **Component:** The affected part of the vehicle/product (e.g., "POWER TRAIN").
7. **Mfr Campaign Number:** Manufacturer's internal reference for the recall.
8. **Recall Type:** Type of product involved (e.g., vehicle, tire, or car seat).
9. **Potentially Affected:** Number of units potentially impacted by the recall.
10. **Recall Description:** Detailed explanation of the defect or issue.
11. **Consequence Summary:** Description of the risks or consequences associated with the defect.
12. **Corrective Action:** Steps taken to address the defect.
13. **Park Outside Advisory:** Indicates whether there's an advisory to park outside for safety.
14. **Do Not Drive Advisory:** Indicates whether there's an advisory not to drive the affected vehicle.
15. **Completion Rate %:** Percentage of affected vehicles repaired or addressed.

## Steps:

### 1. Loading The Dataset

```
[1] import pandas as pd
```

```
[2] df = pd.read_csv('recalls.csv')
```

### 2. Description of the dataset

#### a. Information about dataset

```
df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 28671 entries, 0 to 28670
Data columns (total 15 columns):
#   Column                                     Non-Null Count  Dtype

## 3. Drop columns that aren't useful.

Columns that might not be necessary for analysis include Recall Link, Mfr Campaign Number, Park Outside Advisory, Completion rate(%). These columns do not provide much insight in the context of data analysis for recall trends or consequences. Therefore, you can drop them to simplify the dataset.

```
# Remove leading/trailing spaces from column names
df.columns = df.columns.str.strip()

# List of columns to drop
cols = ["Recall Link", "Mfr Campaign Number", "Park Outside Advisory", "Do Not Drive Advisory", "Completion Rate % (Blank - Not Reported)"]

# Drop the columns that are present in the DataFrame
df = df.drop(cols, axis=1)

# Display the updated DataFrame
print(df.head())
```

	Report Received Date	NHTSA ID	Manufacturer	Subject	Component	Recall Description

Thus the columns now present in dataset are:

```
df.info()

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 28671 entries, 0 to 28670
Data columns (total 10 columns):
#   Column                                Non-Null Count  Dtype
---  -
0   Report Received Date                  28671 non-null  object
1   NHTSA ID                             28671 non-null  object
2   Manufacturer                          28671 non-null  object
3   Subject                              28671 non-null  object
4   Component                            28671 non-null  object
5   Recall Type                           28671 non-null  object
6   Potentially Affected                  28630 non-null  float64
7   Recall Description                    26270 non-null  object
8   Consequence Summary                  23783 non-null  object
9   Corrective Action                    26283 non-null  object
dtypes: float64(1), object(9)
memory usage: 2.2+ MB
```

#### 4. Take care of missing data.

##### a. Drop rows with maximum missing values.

Here we drop the rows which have more than 50% missing values. these can be done by `dropna()` function with threshold parameter=0.5.

```

▶ print(f"Dataset Shape before Dropping Rows: {df.shape}")
# Drop rows with the highest number of missing values
threshold = len(df.columns) * 0.5 # Drop rows where over 50% of columns are missing
df = df.dropna(thresh=threshold)

print(f"Dataset Shape After Dropping Rows: {df.shape}")

```

```

↪ Dataset Shape before Dropping Rows: (28671, 10)
Dataset Shape After Dropping Rows: (28671, 10)

```

```

▶ print(df.isnull().sum())

```

```

↪ Report Received Date      0
   NHTSA ID                 0
   Manufacturer             0
   Subject                  0
   Component                0
   Recall Type              0
   Potentially Affected     41
   Recall Description       2401
   Consequence Summary     4888
   Corrective Action       2388
   dtype: int64

```

## b. Handle Missing Data

Here the above information says Potential Affected ,Recall Description ,Consequence Summary and corrective action contain some null values thus we need to handle missing data.For these columns, either fill in with a placeholder (e.g., "Unknown") or drop the rows if the missing data is significant.

```

[12] # Fill missing numerical values with the median
df['Potentially Affected'] = df['Potentially Affected'].fillna(df['Potentially Affected'].median())
# Fill missing categorical values with a placeholder
df['Recall Description'] = df['Recall Description'].fillna('Not Known')
df['Consequence Summary'] = df['Consequence Summary'].fillna('Unknown')
df['Corrective Action'] = df['Corrective Action'].fillna('Unknown')

print(df.isnull().sum()) # Verify no missing values remain

```

```

↪ Report Received Date      0
   NHTSA ID                 0
   Manufacturer             0
   Subject                  0
   Component                0
   Recall Type              0
   Potentially Affected     0
   Recall Description        0
   Consequence Summary      0
   Corrective Action        0
   dtype: int64

```

## 5. Create dummy variables

For columns containing categorical data (e.g., Recall Type), we can create dummy variables. This is helpful for machine learning models.

```
# Convert categorical columns into dummy variables
df = pd.get_dummies(df, columns=['Recall Type'], drop_first=True)

print(df.head())
```

11  Recall Type_Vehicle                 28671 non-null bool
dtypes: bool(3), float64(1), object(8)
memory usage: 2.1+ MB
```

## 6. Find out outliers (manually):

Outliers can be detected by looking at numerical columns like Potentially Affected. One method for identifying outliers is by visualizing the data using box plots or using statistical methods like the Z-score.

**First Quartile (Q1):**=QUARTILE(H2:H28719, 1)

Q1 = 99

**Third Quartile (Q3):**=QUARTILE(H2:H28719, 3)

Q3 = 6386

**Interquartile Range (IQR):**=Q3 - Q1

$IQR = 6386 - 99 = 6287$

### Outlier Boundaries:

**Lower Bound:**  $= Q1 - 1.5 * IQR$

Lower Bound  $= 99 - (1.5 * 6287) = -9331.5$

**Upper Bound:**  $= Q3 + 1.5 * IQR$

Upper Bound  $= 6386 + (1.5 * 6287) = 15816.5$

**Identifying Outliers:** Any value less than -9331.5 or greater than 15816.5 is considered an outlier.

## 7. standardization and normalization of column

Standardization and normalization are crucial when dealing with numerical data that varies in scale, especially for machine learning algorithms.

```
from sklearn.preprocessing import StandardScaler, MinMaxScaler
# Standardization: Transform data to have a mean of 0 and a standard deviation of 1
standard_scaler = StandardScaler()
df['Potentially Affected (Standardized)'] = standard_scaler.fit_transform(df[['Potentially Affected']])

# Normalization: Scale data between 0 and 1
min_max_scaler = MinMaxScaler()
df['Potentially Affected (Normalized)'] = min_max_scaler.fit_transform(df[['Potentially Affected']])

# Display the updated DataFrame
print(df[['Potentially Affected', 'Potentially Affected (Standardized)', 'Potentially Affected (Normalized)']].head())
```

```
Potentially Affected  Potentially Affected (Standardized) \
0                    18.0                                -0.122429
1                   130.0                                -0.122129
2                   396.0                                -0.121415
3                  74469.0                                 0.077295
4                   107.0                                -0.122190

Potentially Affected (Normalized)
0                    5.625000e-07
1                    4.062500e-06
2                    1.237500e-05
3                    2.327156e-03
4                    3.343750e-06
```

**Conclusion:**

This experiment demonstrated effective data cleaning and preparation techniques. Issues such as missing values, irrelevant data, and outliers were addressed, and the dataset was scaled for uniformity. These steps are essential for ensuring high-quality data and reliable model outcomes.
